Reuters - Weekly data

Profile

The fund deploys a "value" investment strategy aiming to produce high added value in performance generation by selecting stocks which are undervalued and also present a market catalyst

"Value" stock picking involves:

- a rigorous company analysis process based on qualitative and quantitative criteria, and the selection of stocks considered undervalued by the market
- detection of a "catalyst" (restructuring, asset divestment, etc.) giving rise to anticipation of a rally in the market price compared to the industrial value of the company

The portfolio manager considers a stock to be undervalued by the market when the estimated industrial value of the company is greater than the stock market price.

The investment process is discretionary and based upon convictions allowing a high degree of autonomy in investment decisions and the concentration of the portfolio on a restricted number of stocks. Accordingly, portfolio performance may differ from the reference index.

The fund has minimum average asset exposure and investment of 90% in large cap company stocks with registered offices located in a member state of the Euro zone, without any particular geographic or sector allocation.

The fund's objective is to outperform the Euro Stoxx Large Price index over the medium term. The Euro Stoxx Large Price index (denominated in Euros, income

Advantages

Active portfolio management, deploying a unique "value" investment management style, based on stock picking: a specific investment process combining the identification of undervalued stocks and a market catalyst with the construction of high conviction, concentrated portfolios

The portfolio manager has a high degree of autonomy in investment decisions

A recognised expertise: CCR AM is one of the most highly appreciated protagonists in this market and one of the leaders in "value" portfolio management in France. CCR AM is UBS Global Asset Management's Euro / Europe "value" skills centre.

Risks

The main risks incurred by the fund are equity market risk and stock selection risk.

The investment strategy relies on the portfolio manager's anticipations. The anticipations of the portfolio manager may prove inexact compared to the real performance of equity markets and price performance of certain stocks.

High risk profile.

Monthly commentary

During the month the CCR Actions Euro fund gained 5.47%, achieving good relative performance as it exceeded its benchmark index's 4.87% by 0.6% during the period.

The year began with sector rotation, which was not negative for the fund's performance – in fact quite the opposite. Because we believed that the financial sector was selling too cheaply, we had not deserted it. Accordingly, the fund benefited from this broad sector's catch-up period in the new year. Intesa (+20%), BNP (+15%) and Axa (+24%) were amongst the largest contributors to the fund's relative performance.

We may also mention the very good performance of industrial companies Faurecia (+17%) and ST Microelectronics (+14%).

Our few noteworthy changes during the month included exiting Sanofi and reducing the holding of Siemens to cover a large redemption. Finally, we wish to point out that the fund will undergo changes during the month.

CCR Actions Euro will be transformed from a euro large caps fund to CCR Actions Engagement Durable, a fund holding stocks of any size capitalisation and investing in the eurozone with an SRI (socially responsible investing) profile based on commitment and governance. The fund will be managed by Bénédicte Bazi, a specialist manager in the value unit of CCR AM.

Management and other fees

Administrative and management fees cover all fees charged directly to the UCITS (including notably costs of financial management, administrative and accountancy management costs, depository, custodian and auditing charges), with the exception of transaction fees. Transaction fees include intermediation fees (brokerage, stock exchange taxes, etc.). The following fees may also be charged in addition to administrative and management fees:

- outperformance fees. These are paid to the management company if the fund exceeds its objectives. They are therefore charged to the fund;
- fees relating to investments in UCITS or investment funds;
- movement commissions charged to the fund;
- a share of income from the temporary acquisition and sale of securities.

TER

The total expense ratio (TER) corresponds to the total costs associated with managing and operating a fund (as above) expressed as a percentage of the fund's average assets over a financial year.

Reference index (or Benchmark)

This allows the fund's performance to be tracked against a yardstick that is external to the management company.

Investment grade

Term designating bonds rated between BBB- and AAA based on the rating scales of the major agencies and indicating that their credit quality is satisfactory.

Volatility

Volatility is an estimate of the risk on an investment. It is represented by the annualised lognormal standard deviation of the fund's performance. Standard deviation is the square root of the variance of the data points from the mean. The greater the range of performances, the higher the fund's volatility and hence the riskier the fund. Volatility is calculated on a weekly basis.

Sharpe Ratio

The Sharpe Ratio indicates whether the relationship between a fund's risk and its performance is good or bad, the underlying assumption being that the manager would have invested in a risk-free asset. To determine this ratio, the performance of the risk-free asset is subtracted from the annualised performance, and this net performance is then divided by the risk, represented by the annualised volatility. It is calculated on a weekly basis.

The higher the ratio, the better the fund. A negative ratio indicates that the fund's performance is inferior to that of the risk-free asset.

Tracking error

The Tracking Error measures the standard deviation of a fund's relative performances (relative to its benchmark). The lower the tracking error, the more the fund resembles its benchmark in terms of risk and performance characteristics. It is calculated on a weekly basis.

Information ratio

The information ratio is derived by dividing the fund's relative performance by the tracking error. The higher the ratio, the greater the remuneration earned on the risk taken compared with the benchmark. It is calculated on a weekly basis.

Beta

The beta is a risk measurement that indicates the sensitivity of an investment, such as a UCITS or an investment fund, to market fluctuations represented by the corresponding benchmark. For example, a beta of 1.2 means that the value of a UCITS or investment fund is likely to change by 12% for an expected market fluctuation of 10%. This relationship is based on historical statistics and is only an approximation.

Duration and sensitivity

Duration indicates in years the length of time the principal of a bond is tied up. Unlike that of residual life, the concept of duration also takes account of the timing of any cash flows such as payment of coupons. The average duration of the portfolio is represented by the weighted average duration of the various securities. Sensitivity, derived from duration, allows the risk of bonds and of bond portfolios and their sensitivity to changes in interest rates to be measured. Thus, a one-point increase (or decrease) in interest rates leads to a corresponding percentage decrease (or increase).

Vega

The vega represents the fund's sensitivity to a parallel shift in the volatility surface. A vega of 0.2 means that for a 1% rise (or fall) in volatility, the value of the portfolio increases (or decreases) by 0.2%.

Theta

The theta of an option measures the effect of the passage of time on the value of an option.

Delta

The delta measures the portfolio's degree of exposure to equity risk.

Value at Risk (VaR)

VaR represents the maximum probable loss of a fund over a seven-day horizon (five working days) with a confidence interval of 95%. The methodology used is historical VaR.

Price-to-Book

The price-to-book ratio is calculated by dividing a company's market capitalisation by its net assets.

Price Earnings Ratio

The price earnings ratio (PER) is the ratio between a company's quoted share price and its post-tax earnings per share (EPS).
